

Fortune 1000 Company

A Fortune 1000 hired a Chief Marketing Officer looking for a completed digital transformation, which began with a new website. To save time, they outsourced to a third-party agency.

The agency didn't communicate with the internal IT team, which led to a big problem: two weeks before the scheduled launch date, the IT team discovered the agency transferred live customer data to the cloud without installing security controls.

Business Challenge

- Implement security features to protect organizational assets and critical customer data vulnerable to attacks and theft
- Provide ongoing Azure optimization and management

Solution

- Lightstream worked with the company and the agency to devise a plan
- The new website went live eight months later with strict security measures in place to protect customer and company data
- Continual oversight of the cloud environment

Business Outcomes

- The company optimized its environment by leveraging Lightstream's partnerships with Microsoft Azure and Palo Alto Networks to deliver consistent, automated protections with value-added resources
- The security, financial, technological, and operational expertise offered by Lightstream's Cloud Managed Services (CMS) solution has helped the manufacturer improve the day-to-day administration and management of its cloud infrastructure with monthly reports
