Regional Bank

A regional bank moves to Azure with help from Lightstream, Cloud Foundation, and Managed Services. We architected an Azure environment to securely support a new line-of-business application.

Business Challenge

- To accommodate aggressive growth plans and offer a modern customer experience that requires an update to their applications and infrastructure

- Move applications from the company's two costly and unstable active-passive data centers to the cloud

Solution

- Lightstream consultants performed a Cloud Foundation Workshop to establish a baseline before migrating to Azure

- A secure architecture to support the SaaS application, writing custom integration code that enabled the SaaS provider to securely access line-of-business application data in Azure and creating re-factored SQL databases in Azure to support a SaaS solution

Business Outcomes

- A cloud architecture to support strategic business goals and improved cross-IT communication as a result of CMS

- Ongoing cloud management and optimization and access to specialized technical experts
